About this talk

- Something I wrote up for R-Ladies Melbourne in 2018.
- All credit goes to **soon-to-be Dr Chuanxin Liu**.

- **Fun fact:** R-Ladies and Responsible AI meetups → I became a data scientist! 

It's a volcano plot if...

- You are comparing between **2 different groups of samples**.
- You are interested in visualising **how much** group B **differs** with respect to group A.

Group A: healthy cells

Group B: 'diseased' cells

It's a volcano plot if...

- You also have lots of data points collected for both samples.
- Equivalence (**in unit**) between these data points.

Group A: healthy cells

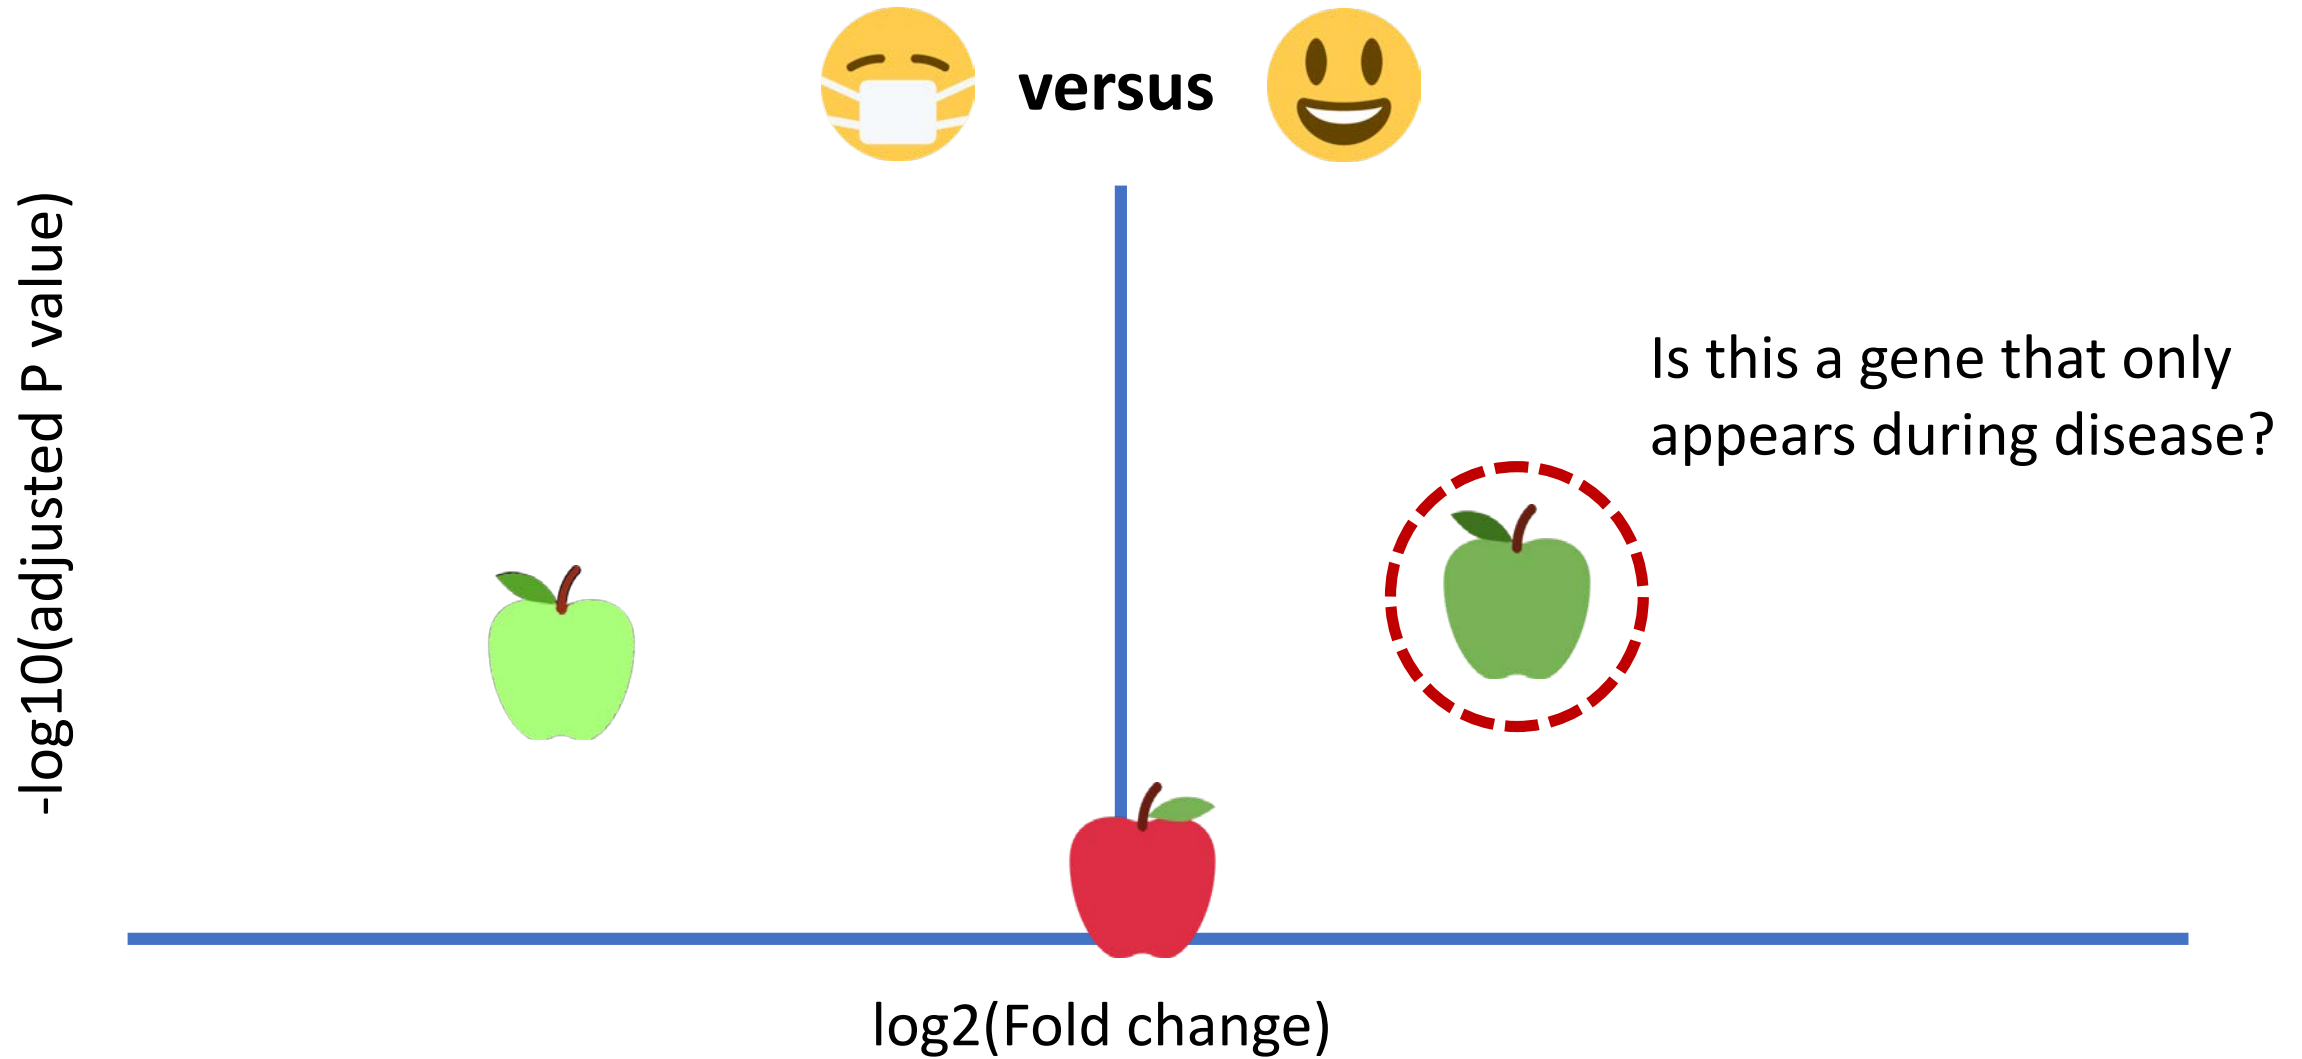

Group B: 'diseased' cells

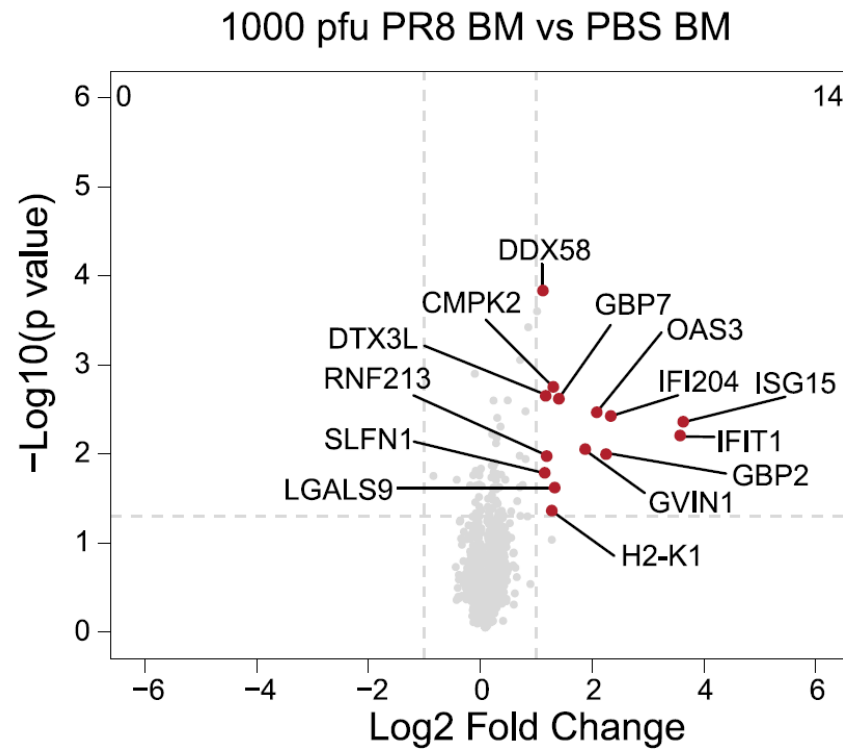

Gene A		4	3	9	7	2	3	3	5	6	2
Gene B		3	6	7	3	4	25	34	21	40	38
Gene C		11	13	7	8	17	0	2	5	1	0

It's a volcano plot if...

Volcano plot: just another way to communicate complex information

Liu et al, 2019, Journal of Immunology 203 (4)

**Let's use this as an excuse to play
around with ggplot2  !**
